Ecole de biologie

#### The Master program has a normal duration of 3 semesters and comprises 90 ECTS :

Module 1 : 15 ECTS : Compulsory (9 ECTS) and optional courses (6 ECTS)

Module 2 : 15 ECTS : First step project

Module 3 : 15 ECTS : Optional courses

Module 4 : 45 ECTS : Personal research project (Master thesis)

Training objectives are available in its programme regulations.

#### Autumn Semester (semester 1)

Courses / Enseignements Hours per semester		Hours per semester		Teaching Staff	ECTS Credits	Limited nl of
	С	E/S	PW			student

#### **BIOLOGICAL SECURITY**

Patrick Michaux

С	Obl	English	2
А			

N: Master

P: A basic knowledge of microbiology and vegetal science

- O: To familiarise future researchers with legislation concerning genetic engineering. In addition, possible biological risks associated to different applications of this technology will be discussed with the help of examples. This teaching is a mandatory prerequisite for First-Step.
- C: \* Legislation: article 24 of the Federal Constitution; law concerning environmental protection; law concerning epidemics; ordnance on protection against major accidents; Swiss commissions on biological security: notification and registration of projects.

\* Biological security in the laboratory: containment; security equipment; technical measures: laboratory construction; standard laboratory (microbiological) practice; classification of biological material: plasmids, microorganisms, cell lines, primary cells; security levels 1-4.

\* Release of genetically modified bacteria in the environment: monitoring, survival and dissemination, ecological impact, transfer of genes, containment systems.

\* Potential biological risks associated with the use of transgenic plants: dissemination, cross-pollination, gene transfer.

\* The problem of recombinant vaccines: vectors, DNA vaccines.

- \* Somatic genetic therapy I: Illnesses accessible to treatment by somatic genetic therapy, gene transfer methods.
- \* Somatic genetic therapy II: Evaluation of the biological risk for the patient and his environment.

#### DATA ANALYSIS

#### Sven Bergmann

С	Obl/Opt	English	6
А	2		
TP	Obl/Opt	English	6
А			

P: We assume nothing more than the mathematics you would have obtained in your studies when you were 18.

O: In this course the goal is to be able to formulate hypotheses properly, design experiments, whether in the laboratory, in a clinic, or in the filed, that have sufficient power to test these hypotheses, conduct appropriate statistical tests of the data generated, generate clear figures, and interpret the results obtained.

#### C: We will cover:

- 1. Distributions and random variables
- 2. Variance, covariance and measures of association
- 3. Constructing statistical tests using distributions
- 4. Regression
- 5. Non-linear regression

#### INTRODUCTION INTO SCIENTIFIC WRITING

Robert Waterhouse

С	Obl	English	7
А	2		
E	Obl	English	9
А			

#### N: Master

P: Lecturing and paper writing are in English.

O: This short but intensive block course introduces students to the practice of scientific writing (and aspects related to publishing in peer-reviewed scientific journals).

We will discuss questions/topics such as:

- Why is it important to publish?
- What is good/clear versus bad/unclear (scientific) writing?
- How to learn how to write well?
- How to structure and write a good scientific manuscript?
- The submission, editorial and reviewing process.
- How to review someone else's paper?

- Plagiarism and publication ethics

Publishing is of key importance in scientific research: your job as a scientist is not finished until you have published your results - science is to a very large extent about effectively communicating your results and insights, i.e. what you have learned about how nature works.

The ultimate aim of this intensive course is thus to equip students with a solid understanding of how to effectively communicate their research in writing.

#### C: Course Content

The course includes both lectures and practical exercises in class, distributed over four half-days. The lectures will give a broad and brief overview of different aspects of scientific writing and publishing as well as on plagiarism and publication ethics; however, the major emphasis of the course is on practical work on the part of the students. During the practical parts the students will learn, from scratch, the fundamental structure and essential components of scientific writing, how to write effective outlines/drafts and - most importantly - how to write complete, clear, well-structured papers. These practical exercises will thus require students to do reading and writing assignments, often under a bit of time pressure.

At the beginning the exercises will be worked on by teams of 2-4; towards the end, each student will work individually. Finally, to get a grade for this class, students will have to complete a written report (homework assignment). For each exercise as well as for the written report we will give detailed and individualized feedback. Note that all lecturing and assignment writing are in English.

#### Detailed Programme

Module 1: Lecture 1: Writing papers: overview of why and how.

We will discuss the following: Overview of class and organizational things (incl. homework assignments). Why is it important to publish? What is good/clear versus bad/unclear (scientific) writing? How to learn how to write well? [We will also briefly touch upon issues of good scientific practice and conduct, and various ethical issues connected to publishing.] Approx. 2 hours.

Module 1: Practical 1. Summarise a paper: title, keywords, abstract.

In groups of 2-3. Read the assigned (stripped down and short) manuscript and come up with a title and with keywords. Then write a short abstract (< 200 words). Approx. 1.5 hours. We will then discuss the solutions you have come up with, and their potential pros and cons, together in class. Approx. 30 mins.

Module 2: Lecture 2: Writing papers: details on structure, drafting, revising.

We will discuss the basics and essentials of writing a scientific paper (and also what not to do!). Specifically, I will explain how a paper should be structured and sub-structured, how to draft a paper (i.e., how to get started), how to build and complete a full manuscript, and then how to improve it by continuous and aggressive revising and re-revising. I will also give you hints and tips for effective writing. Approx. 1.5 hours.

Module 2: Practical 2. Write a paper: your own nano-paper from results.

I will give you some data/results (e.g., data figures/tables/legends/statistical outcomes) to choose from. Form teams of 3-4 people. Ask yourself: What do the results/tables/figures/analyses show and mean? Then prepare a very short nano-paper (2 pages max), including: Title, Abstract, Introduction, Materials and Methods, Results, Discussion and Conclusion (there are some other components in a paper that we will skip for the sake of this exercise). Each component should be between 1 and 3-4 sentences maximum. Approx. 2 hours. We will then discuss your solutions and their potential pros and cons together in class; Approx. 30 mins. We will then give you detailed feedback on your papers by e-mail after the course.

Module 3: Lecture 3: Publishing papers: understanding the whole process.

We will briefly recapitulate what we have discussed and learned so far, and then focus on the 'final' stages of writing a paper and submitting it to a journal. Approx. 1 hour

Module 3: Practical 3: Review a paper: critically assess a manuscript.

What distinguishes a good from a bad manuscript? Now you are the reviewer! Being a critical reviewer will help you to learn to distinguish between good and bad writing and thus help you to improve your own scientific writing. You will be given a short, stripped-down manuscript. Team up in groups of 2-3. Read both manuscripts critically, then make pro and contra lists for both manuscripts. Briefly explain why you would accept/reject (or reach some other decision) the manuscript for publication (

#### MOLECULAR METHODS IN ECOLOGY AND EVOLUTION

Luca Fumagalli, Ian Sanders

С	Obl/Opt	English	18
А	3.5/5		
TP	Obl/Opt	English	42
А			
N: Master			

O: The objective of this course is to learn the relevant molecular tools that are currently used in ecology, evolutionary and conservation biology research and understand why and when to apply them.

- C: This course covers the reasons why molecular genetics is a necessary tool in many ecology, evolution and conservation biology projects. We study its uses and then look at at selection of techniques, particularly for looking at polymorphism, that are not traditionally taught in molecular cell biology courses. Man of the techniques can only be learnt in the classroom as there is not enough time in a week to practically learn all useful techniques. Therefore, the associated laboratory class cover some of the fast techniques that are useful for studying polymorphisms in populations.
- B: The course is mostly based on publications in international journals rather than one specific book. The publications are made available in pdf format at the beginning of the course.

#### SEMINARS OF THE DEPARTMENT OF ECOLOGY AND EVOLUTION

Tadeusz Kawecki

	S	Obl	1	English	14
	А				
	S			English	14
	S				
N:	Master				
P:	All seminars and discussions are in English				

O: Learn about the current research of other groups and meet international experts.

C: International experts present their research and answer to questions in public.

#### ADVANCED DATA ANALYSIS

Giovanni Ciriello

С	Obl/Opt	English	6
А	2.5		
TP	Obl/Opt	English	6
А			

#### N: Master

P: You must have attended the first data analysis course, or convince me that you are competent at basic statistical analyses.

O: The aim of this course is to build upon the data analysis course, to prepare you to handle a range of different data and more complex analysis problems.

C: In this course we will cover:

1. Repeated measures models and mixed effects models.

2. Survival analyses

3. Bayesian statistical inference

#### ANIMAL COMMUNICATION AND PARASITISM

Philippe Christe

	С	Opt	English	14
	А	1.5		
N:	Master			

- P: None
- O: Across the animal kingdom, individuals of the same species differ in their propensity to take risks, and explore new environments, and to be active, aggressive or sociable. Individual differences in behaviour that are consistent through time and across contexts are coined 'personalities', 'behavioural syndromes' or 'temperaments'. The terminology of personality is not a mere fashionable label of something usually studied by behavioural ecologists, but useful to conceptualize the common phenomenon that individuals differ markedly and consistently in their behavioural phenotypes across ecological and social contexts. The notion of personality implies that suites of behaviours are correlated within individuals and hence individuals are less flexible than would be expected under optimality models. In this course, I propose to study personality from an evolutionary point of view and also the evolution of language.
- C: This lecture is interactive and illustrated by recent research articles. 7h will be given by A. Roulin and 7h by P. Christe

#### INTRODUCTION TO PRIMATE BEHAVIOUR, COGNITION AND CULTURE

Erica Van de Waal

С	Opt	English	8
А	1.5		
S	Opt	English	6
А			

#### N: Master

- O: The first goal of this course is to give a general introduction into primate behaviour, with a special focus on primate cognition and culture. The topic will be developed in a comparative framework, with references to behaviours found in other animals as well as well highlighting behaviours shared between human and non-human primates and the ones unique to humans. This first part will give the general background to understand the articles that will be discussed in the seminar sessions. During the seminar, students will select articles to read and discuss together. This part aims at developing the critical thinking of students and the exchange between the students using concrete examples of research with conflicting findings. The course will train students to summarize, explain and discuss a paper during the final presentation in front of the class, as well as to develop ideas about potential future directions of the research on a specific topic.
- C: This course will be composed of three main parts followed by seminar sessions.

1) Primate Behaviour. Here we will study briefly the bases of animal behaviour followed by a presentation of the diversity in the taxa Primates. Then we will study the specificities of Primate behaviour. We will investigates the topics of social structure, reproduction and life history. Later we will focus more on social relationships with lectures on competition and conflict management, communication and cooperation. All these topics will be discussed with a comparative approach to other animals and humans.

2) Primate Cognition. Here we will study the cognitive abilities of primates. We will investigate briefly the specificities of primate physical cognition and we will develop more on their social cognition. On this topic, we will study the abilities of primates to understand others' minds (theory of mind) and to exhibit strategic social behaviours like deception.

3) Primate Culture: Here we will study social learning mechanisms and strategies. We will investigate cases of conformity, traditions and culture in primates. This subject will highlight the specificities of human cultural behaviour as well as the shared roots with primates and other animals.

During the seminar, students will choose a scientific article to read (alone or in groups depending on the number of students following the course). The papers will be discuss in the class. At the end of the seminar, all the students will present the main finding of their paper and potential future directions of research on the topic.

N: Master

P: Practicals performed during the bachelor (molecular biology, genetics, biochemistry, bioinformatics)

O: - An initiation to the work of a scientist

- Conduct experimental work in research lab (wet bench or in silico)

- Interpretation of research results

- Implement basic principles in experimental design (e.g. include the appropriate controls, statistical significance of the results etc...)

- Present your experimental work in a written report which will be organized like a typical research article (intruduction, results, discussion, materials and methods)

- present your work orally (seminar style)

C: Perform laboratory work for about 12 weeks during the time when the student does not follow theoretical classes. This research project will typically be performed under the guidance of a PhD student or a post-doc from the host laboratory.

#### Spring semester (semester 2) and Autumn Semester (semester 3)

JULE 4		ECTS Credits
Master Thesis Travail de Master	Thesis Director	45

The pandemic has shown us that circumstances beyond our control may require us to make the following adjustments / adaptations to study plans during the semester:

• possibility to switch from one mode of teaching to another (face-to-face <-> distance, synchronous <-> asynchronous, switch to co-modal teaching where it was not initially planned).

• change / modification of evaluation modalities, without inducing derogations from the Study Regulations (oral <-> written, exam <-> validation, individual work <-> group work, practical work <-> theoretical work, face-to-face evaluation <-> online evaluation, etc.)

• alternative or time-shifted modalities for teachings, internships, practical work, fieldworks and camps that could not take place or teachings that could no longer take place in the form initially planned.

Students are invited to consult this document regularly (Study Plan & Evaluation Procedure)

Jérôme Pellet

N:	Master					
P:	BSc level in	biology, includir	ng e	cology		
0:	<ul> <li>Applied ecology is a young crisis discipline undergoing a major effectiveness revolution. In most situations, urgent action is necessary, even in the absence of reliable information. How do we gather sound ecological information? How do we use it to plan natural communities conservation? In the process of answering these questions, wildlife ecologists often realize that research and practice are just two sides of the same coin.</li> <li>After this lecture, students are able to understand the underlying concept of evidence-based conservation and adaptive management. They have applied the concepts in several different conservation settings.</li> </ul>					
C:	After this lecture, students are able to understand the underlying concept of evidence-based conservation and adaptive management. They have applied the concepts in several different conservation settings.					

methods through the prism of adaptive management. « There is no such thing as a special category of science called applied science; there is science and its applications, which are related to one another as the fruit is related to the tree that has borne it. » Louis Pasteur

#### **BIOLOGICAL INVASIONS**

Cleo Bertelsmeier

С	Opt	English	14
S	1.5		

N: Master

O: 1. Explain core theory and concepts underlying the spread and impacts of invasive species

- 2. Critically assess the current debate about invasive organisms (semantic, social, economic, biological..)
- 3. Understand how globalization leads to the accelerating dynamics of species ranging from viruses to mammals
- 4. Understand the characteristics of invasive species and vulnerable ecosystems
- 5. Discuss the interactions between biological invasions and other drivers of global change such as climate change
- C: Biological invasions are considered one of the most important global threats to biodiversity. Understanding the processes shaping the success of species outside of their native ranges is therefore a major goal of conservation research. In this course, we elucidate the main hypotheses explaining the success and spread of invasive species, while insisting on current controversies and future research questions. Specifically, we will address:
  - The different stages of the invasion process (transport, establishment, spread, impacts)
  - Impacts and case studies of some of the worst invasive species
  - Mechanisms of invasions
  - Socio-economic aspects
  - The role of rapid adaptation in the invasion process
  - Species interactions, enemy release, community structure
  - Large scale patterns and dynamics
  - Interactions with other drivers of global change

B: See English pages of the course

#### **CO-EVOLUTION, MUTUALISM AND PARASITISM**

lan Sanders

С	Opt	English	14
S	1.5		

N: Master

P: Must understand english and be prepared to give presentations

- O: To understand the evolutionary consequences of organisms living together in mutualism or parasitism and how to investigate it experimentally
- C: The course comprises some introductory talks given by me about concepts in co-evolution and theoretical frameworks for studying co-evolution. Afterwards, students give presentations on chosen key publications in this field and the group discusses these subjects after the presentations.
- B: : All bibliography is made available in pdf format before the course begins. For an example of the publications discussed you can find last years publications in my docunil public folder.

#### COMPARATIVE GENOMICS: FROM THOUSANDS OF GENOMES TO SINGLE CELLS

Roman Arguello

С	Opt	English	7

N:	Master							
P:	Lectures, discussions, and proposal writing in English.							

- some important problems of conservation biology
- funding opportunities for conservation projects

- the planning, writing, and reviewing of grant proposals in the context of the course

Own ideas shall be developed, presented and discussed in class.

C: Some current research topics within the field of conservation biology will be further introduced in lectures, potentially also guest lectures, and discussions in class. Each student then develops an own idea of a research project within these topics. After an introduction into funding agencies and the planning and writing of grant proposals, each student (or groups of two) write(s) up an own proposal and present(s) it to the class. The proposals of colleagues will then be peer-reviewed after an introduction into peer-reviewing of grant proposals. Class size restricted to 10 students.

O: Introduction into

#### HONEYBEE ECOLOGY, EVOLUTION AND CONSERVATION

Vincent Dietemann

С	Opt	English	14
S	1.5		

#### N: Master

- O: This series of lectures will show the complexity of insect societies, taking the honey bee as an example. It will give the opportunity to see how concepts learned elsewhere by the students can be placed within the context of a single species.
- C: Since honeybees are economically important insects, they have been studied early in history and the knowledge we possess about them is greater than for any other social insect species. Our understanding of the honeybee reveals the complex organisation reached by insects when they form societies. This series of lectures will present some aspects of this complexity that will be replaced within its evolutionary context. Various aspects of honeybee ecology and evolution, including geophylogeny, biology, reproduction at individual and colony level, division of labour, communication, economical value, pathogens will be presented.
  After a general introduction of this model species describing the diversity and biogeography of the taxon, we will dissect the communication abilities of European honeybees and compare it with related Asian species. We will see how this communication is used to organise foraging tasks sustaining colony growth. Honeybee health is a current concern and we will review the pathogens affecting them and comment the role of humans in their spread and
- control in an evolutionary context. Since honeybees are globally threatened, we will see what economical losses their decline could have and some conservation projects to invert the trend will be put in context.

#### **MICROBIOME ANALYSIS**

Jan Roelof van der Meer

С	Opt	French	8
S	1.5		
E	Opt	French	16
E S	Opt	French	16

P:	None. Practicals will involve working with R.

O: The goal of this class is to give an overview of different host-related and environmental microbiomes, of theory on microbiome development and community growth, and to explain a number of regular microbiome analysis tools. This really cool class will involve different teachers and collaborators working within the National Centre of Competence in Research on Microbiomes. It will consist both of frontal presentations, questions and discussion sessions, and practical work.

Teachers are: Pascale Vonaesch, Jordan Vacheron, Joanito Liberti, Senka Causevic, Helena Todorov, Maxime Batsch, Jeanne Tamarelle, Daniel Garrido and Jan van der Meer (all from UNIL); Joao Matias Rodriguez (UNIZH), Guillem Salazar, Alessio Milanese and Sebastian Pfeilmeier (ETHZ).

- C: Content is still open to last-minute changes, but will likely consist of the following lectures: - General overview on microbiomes: what are they, how do they function?
  - Diversity analysis techniques
  - High-througput functional techniques
  - Meta-omics techniques
  - The soil microbiome
  - The rhizosphere microbiome
  - The plant leaf microbiome
  - The human and animal gut microbiome
  - Gut-brain axis
  - The following practicals are being prepared:
  - soil microbiome diversity
  - metatranscriptomic data analysis
  - microbeAtlas

B: Course material will be uploaded on Moodle shortly before the classes.

#### SCIENTIFIC COMMUNICATION - SCIENTIFIC HANDS-ON WORKSHOP MODULE

Alain Kaufmann, Philippe Reymond

N: Master

#### SCIENTIFIC MEDIATION AND COMMUNICATION - MUSEUM MODULE

Olivier Glaizot

	С	Opt	E	English	6
	S	3			
	TP	Opt	E	English	22
	S				
N:	Master				
P:	None				

O: This is a theoretical and practical course which will teach you how to write a text for an exhibition (scientific popularization). From original articles and textbooks to the exhibition content, several steps are required to make the exhibition attractive and accessible to a large audience. During this course, you will learn the basics of exhibition building, from content development to the elaboration of a mediation concept and a communication strategy.

C: After a 6 period's theoretical introduction, you will develop a personal project. This year, we will propose general subjects linked to biology. We will propose individual subjects to be developed during the first lecture hours. We are also expecting from you to create a press release on your subject, as well as a mediation project.

#### SEX, AGEING AND FORAGING THEORY

Charles Mullon

С	Opt	English	9
S	1.5		
TP	Opt	English	9
	opt	J	
S			

N: Master

P: Ability to program in R or other languages.

O: Introduction to theoretical principles and modelling approaches to fundamental problems in evolutionary ecology.

Understand the biological factors that influence the evolution of ageing, sex, and resource consumption.

Learn to conceputalise a biological problem and analyse it quantiatively.

Introduction to individual-based simulations.

C: We explore the evolution of sexual reproduction, ageing and resource consumption, through three big questions:

1. Why do we age? 2. Why do we reproduce sexually?
3. How should we consume resources?

We look at these questions through mathematical and computational modelling. In addition to core concepts of evolutionary ecology, students thus learn how to formalize a theoretical model, implement it in a computer program (e.g. R, C or Python) and analyse its output.

#### SPATIAL MODELLING OF SPECIES AND BIODIVERSITY

Antoine Guisan

	С	Opt	English	14
	S	3		
	E	Opt	English	14
	S			
N: N	laster			

P: If possible, course 'Spatial Analyses & GIS' (ANSPAT) in 1st semester of the Master (not strictly required).

O: Species distribution models (SDMs) are increasingly important in ecology and conservation biology. This course proposes an introduction to these models and related concepts and methods. Overview of the main steps of model building. Advantages and limitations. Applications to various domains (climate change, invasions, rare species, ...).

C: Chap. 1. Introduction to species' niche & distributions, and related models. Theory and principles behind these models. Competition and disperal limitations. Types of response variables, main predictive modelling approaches, field sampling design, from predicting species distributions to predicting communities. Chap. 2. Model calibration. Presence-only versus presence-absence data, statistical theory and methods for presence-only data, regressions and classifications for presence-absence, ensemble modelling and forecasting. Chap. 3. Model evaluation. Internal versus external evaluation. Data and metrics for evaluation. Crossvalidation, jackknife, bootstrap, uncertainties. Chap. 4. Assumptions behind these models. Pseudo-equilibrium, niche conservatism, niche completeness, realized niche, and other postulates.

#### THE EVOLUTION OF COOPERATION : FROM GENES TO LEARNING AND CULTURE Laurent Lehmann

С	Opt	English	28
S	3		

- N: Master
- O: What makes us such a unique species, able to cooperate in large-scale societies, organize social interactions, and dominate ecologically the Earth? The main goal of this course is to provide the foundations of social evolution, which consists of two main ingredients in humans: cooperation and cumulative cultural evolution. On one side, the course will thus focus on studying the main forces favoring and maintaining cooperation (mutually beneficial interactions, altruism) and conflict (cheating, malevolence, warfare) in group-structured populations. On the other side, we will study the forces behind cultural evolution, where behavior in interactions depends on genetic determinants, social learning, and individual learning ("gene-culture coevolution"). This will allow discussing the major steps in human social organization evolution, from primate autarky to division of labor in large-scale societies.
- C: The course will be composed of five main parts and more focused on human behavior than the "Ecology and Evolution" class on which it builds:

(1) Cooperation and conflict in well-mixed populations. Here, we will study the evolution of cooperation (and cheating) in well-mixed population (no division into groups). We will study the standard one-shot social dilemmas illustrating the tension between self-interest and group-interest, like the prisoner's dilemma and the stag-hunt game. We will then investigate various settings of repeated interactions, where reputation dynamics between individuals are crucial to sustain long-term relationships.

(2) Cooperation and conflict in group-structured population. Here, we will study the forces shaping cooperation when interactions occur in group-structured populations (the rule in humans), and where the localization of the social interactions generates in the same time novel incentives to cooperate and novel incentives for spiteful behavior. We will also consider conflicts between groups and study warfare in small-scale hunter-gather societies. (3) Social learning and gene-culture coevolutionary theory. Here, we will study the main modes of social learning ("cultural transmission"), which underlies cumulative cultural evolution that is the main determinant of the human lineage ecological success. We will also study gene-culture coevolution and how social learning impacts the dynamics of cooperation within groups.

(4) Individual learning and preferences. Here, we will discuss the main modes of individual learning that allow individuals to learn information about the relevant behavior to express on their own (e.g., trial-and error learning and related decision heuristics, maximizing behavior). We will investigate the conditions under which evolution may and may not lead individuals to become equipped with goal functions ("utility maximization behavior").

(5) Major transition from small to large-scale societies. Here, we will discuss the main evolutionary steps that took the human lineage in a 6 million year long co-evolutionary gene-culture ride from self reliant primate social organizations ("autarky") to large scale societies with extreme division of labor ("catallaxy"). This transition involved a zizag path from dominance, to egalitarianism, to inequality again.

## LIST OF COURSES

#### BIOLOGICAL CONSERVATION OF THE MEDITERRANEAN REGION

Alexandre Roulin

Т	Opt	English, French	40
A S	2		

N: Master

P: Financial participation required by the student.

- O: Faunistic knowledge on birds, insects, crustaceans, mammals and reptiles with an emphasis on conservation issues. We will visit several places (Extermadura, Andalucia around the Doñana national parc, Tarifa and Brazo del Este) where the fauna is fundamentally different and habitats have suffered from human activities to different degrees.
- C: Excursions and group field work. Discussion of scientific articles about conservation issues of Spanish endangered species. Additionnally, each student shall be responsible for the study of one endangered species. Discussion of projects that could be carried out in Spain to answer questions on evolutionary biology, behavioural ecology and conservation.

B: Polycopié distributé aux participants

#### DRIVERS OF INVERTEBRATE BIODIVERSITY ALONG ECOLOGICAL GRADIENTS

Tanja Schwander

С	Opt	English	7
S	3		
		E 11 1	10
Т	Opt	English	49
T S	Opt	English	49

P: Program requirement: Financial participation required by the student (approximately 700.-)

O: During this field course, we study different invertebrate taxa (mainly insects and gastropods) to understand the factors driving biodiversity and community composition, as well as the evolution of different life cycles under diverse ecological conditions in the Swiss Alps/Prealps.

C: Course content:

- Introductory lectures

- Excursions and group field work: analysis of community composition and biodiversity in various habitats

- Personal experiments (experimental design, data collection & analysis, presentation of results)

- Discussion of scientific papers

#### EVOLUTION AND BIOGEOGRAPHY OF SEMI-ARID AND ISLAND FLORAS

John Pannell

Т	Opt	French	40
S	2
