SUR programme 2025  
Robinson-Rechavi lab Project description

Within the development of the Bgee database of gene expression in animals (both biomedical models and evolutionary biodiversity), the student can chose one of two directions:

1. Use Bgee to study the evolutionary and functional relevance of gene expression variability, from single cells to populations of organisms.
2. Develop new features of Bgee, in relation to single-cell biology.

Bgee is available at [bgee.org](https://bgee.org) and is a Global core biodata resource.
