I: Additional information

### ABBREVIATIONS

#### TYPE OF COURSE

- Attest. Attestation  
- C Course  
- C/S Course - seminar  
- Cp Camp  
- E Exercises  
- Exc Excursion  
- Lg Guided lecture  
- S Seminar  
- T Fieldwork  
- TP Practical work

#### STATUS

- Fac Facultative  
- Obl Compulsory  
- Opt Optional  
- Fac/Comp/Opt Facultative, compulsory or optional (according to the study programme)

#### SEMESTER

- Sp Spring  
- A Autumn
The Master program has a normal duration of 3 semesters and comprises 90 ECTS:

- **Module 1**: 15 ECTS: Compulsory courses (10 ECTS) and Optional courses (5 ECTS)
- **Module 2**: 15 ECTS: First Step Project
- **Module 3**: 30 ECTS: Compulsory courses (12 ECTS) and Optional courses (18 ECTS)
- **Module 4**: 30 ECTS: Personal Research Project (Master Thesis)

**For specialisation Behaviour, Economics and Evolution (BEE) (30 ECTS), the student must obtain:**

- **Module 1**: 6 ECTS with Compulsory interdisciplinary courses (marked in blue)
- **Module 3**: 12 ECTS with Compulsory interdisciplinary courses (marked in blue) and 12 ECTS with Optional courses at least 3 ECTS with Disciplinary optional courses (marked in green) and at least 6 ECTS with Interdisciplinary optional courses (marked in blue)

**Modules 2 and 4**: have to be in behaviour, economics and evolution fields, validated by the head of BEE specialisation

**Training objectives** are available in its programme regulations.

**Specific training objectives**: At the end of the course the students will be able to:
- Interact with biologists and economists alike and thus foster and stimulate interactions between these two fields of study.
- Respond to a biological question of behaviour and/or conservation and resource management by mobilising relevant economic science concepts.

### Autumn Semester (semester 1)

N: Master

P: A basic knowledge of microbiology and vegetal science

O: To familiarise future researchers with legislation concerning genetic engineering. In addition, possible biological risks associated to different applications of this technology will be discussed with the help of examples. This teaching is a mandatory prerequisite for First-Step.

C: * Legislation: article 24 of the Federal Constitution; law concerning environmental protection; law concerning epidemics; ordinance on protection against major accidents; Swiss commissions on biological security: notification and registration of projects.
* Biological security in the laboratory: containment; security equipment; technical measures: laboratory construction; standard laboratory (microbiological) practice; classification of biological material: plasmids, microorganisms, cell lines, primary cells; security levels 1-4.
* Release of genetically modified bacteria in the environment: monitoring, survival and dissemination, ecological impact, transfer of genes, containment systems.
* Potential biological risks associated with the use of transgenic plants: dissemination, cross-pollination, gene transfer.
* The problem of recombinant vaccines: vectors, DNA vaccines.
* Somatic genetic therapy I: Illnesses accessible to treatment by somatic genetic therapy, gene transfer methods.
* Somatic genetic therapy II: Evaluation of the biological risk for the patient and his environment.

N: Master
P: We assume nothing more than the mathematics you would have obtained in your studies when you were 18.
O: In this course the goal is to be able to formulate hypotheses properly, design experiments, whether in the laboratory, in a clinic, or in the filed, that have sufficient power to test these hypotheses, conduct appropriate statistical tests of the data generated, generate clear figures, and interpret the results obtained.
C: We will cover:
1. Distributions and random variables
2. Variance, covariance and measures of association
3. Constructing statistical tests using distributions
4. Regression
5. Non-linear regression

**N:** Master

**P:** Lecturing and paper writing are in English.

**O:** This short but intensive block course introduces students to the practice of scientific writing (and aspects related to publishing in peer-reviewed scientific journals). We will discuss questions/topics such as:
- Why is it important to publish?
- What is good/clear versus bad/unclear (scientific) writing?
- How to learn how to write well?
- How to structure and write a good scientific manuscript?
- The submission, editorial and reviewing process.
- How to review someone else's paper?
- Plagiarism and publication ethics

Publishing is of key importance in scientific research: your job as a scientist is not finished until you have published your results - science is to a very large extent about effectively communicating your results and insights, i.e. what you have learned about how nature works.

The ultimate aim of this intensive course is thus to equip students with a solid understanding of how to effectively communicate their research in writing.
C: Course Content
The course includes both lectures and practical exercises in class, distributed over four half-days. The lectures will give a broad and brief overview of different aspects of scientific writing and publishing as well as on plagiarism and publication ethics; however, the major emphasis of the course is on practical work on the part of the students. During the practical parts the students will learn, from scratch, the fundamental structure and essential components of scientific writing, how to write effective outlines/drafts and - most importantly - how to write complete, clear, well-structured papers. These practical exercises will thus require students to do reading and writing assignments, often under a bit of time pressure.

At the beginning the exercises will be worked on by teams of 2-4; towards the end, each student will work individually. Finally, to get a grade for this class, students will have to complete a written report (homework assignment). For each exercise as well as for the written report we will give detailed and individualized feedback. Note that all lecturing and assignment writing are in English.

Detailed Programme
Module 1: Lecture 1: Writing papers: overview of why and how.
We will discuss the following: Overview of class and organizational things (incl. homework assignments). Why is it important to publish? What is good/clear versus bad/unclear (scientific) writing? How to learn how to write well? [We will also briefly touch upon issues of good scientific practice and conduct, and various ethical issues connected to publishing.] Approx. 2 hours.

In groups of 2-3. Read the assigned (stripped down and short) manuscript and come up with a title and with keywords. Then write a short abstract (< 200 words). Approx. 1.5 hours. We will then discuss the solutions you have come up with, and their potential pros and cons, together in class. Approx. 30 mins.

Module 2: Lecture 2: Writing papers: details on structure, drafting, revising.
We will discuss the basics and essentials of writing a scientific paper (and also what not to do!). Specifically, I will explain how a paper should be structured and sub-structured, how to draft a paper (i.e., how to get started), how to build and complete a full manuscript, and then how to improve it by continuous and aggressive revising and re-revising. I will also give you hints and tips for effective writing. Approx. 1.5 hours.

Module 2: Practical 2. Write a paper: your own nano-paper from results.
I will give you some data/results (e.g., data figures/tables/legends/statistical outcomes) to choose from. Form teams of 3-4 people. Ask yourself: What do the results/figures/tables/analyses show and mean? Then prepare a very short nano-paper (2 pages max), including: Title, Abstract, Introduction, Materials and Methods, Results, Discussion and Conclusion (there are some other components in a paper that we will skip for the sake of this exercise). Each component should be between 1 and 3-4 sentences maximum. Approx. 2 hours. We will then discuss your solutions and their potential pros and cons together in class; Approx. 30 mins. We will then give you detailed feedback on your papers by e-mail after the course.

Module 3: Lecture 3: Publishing papers: understanding the whole process.
We will briefly recapitulate what we have discussed and learned so far, and then focus on the ‘final’ stages of writing a paper and submitting it to a journal. Approx. 1 hour.

Module 3: Practical 3: Review a paper: critically assess a manuscript.
What distinguishes a good from a bad manuscript? Now you are the reviewer! Being a critical reviewer will help you to learn to distinguish between good and bad writing and thus help you to improve your own scientific writing. You will be given a short, stripped-down manuscript. Team up in groups of 2-3. Read both manuscripts critically, then make pro and con lists for both manuscripts. Briefly explain why you would accept/reject (or reach some other decision) the manuscript for publication (
This course provides an introduction to microeconomics, game theory, and industrial organization. Economics is a social science, offering a coherent theory with the aim to explain human behavior. Students learn to 'think like an economist' and to apply the theory to real world problems. The course contains both a graphical and intuitive approach and the basic analytical tools necessary to understand microeconomic models and to solve microeconomics optimization problems.

The course will cover the following topics:

- Microeconomics:
  - Consumer behavior
  - Firm behavior
  - Supply and demand in competitive markets
  - Welfare theorems
  - Externalities

- Game theory:
  - Strategic interaction
  - Static games of complete information
  - Dynamic games of complete information
  - Repeated games

- Industrial organization:
  - Imperfect competition, monopoly, oligopoly
  - Price discrimination
  - Cartel formation

B:
- Lecture notes, slides, and problem sets

### N:
Master

### P:
You must have attended the first data analysis course, or convince me that you are competent at basic statistical analyses.

### O:
The aim of this course is to build upon the data analysis course, to prepare you to handle a range of different data and more complex analysis problems.

### C:
In this course we will cover:
1. Repeated measures models and mixed effects models.
2. Survival analyses
3. Bayesian statistical inference
# ANIMAL COMMUNICATION AND PARASITISM

### English 14

**N:** Master

**P:** None

**O:** Across the animal kingdom, individuals of the same species differ in their propensity to take risks, and explore new environments, and to be active, aggressive or sociable. Individual differences in behaviour that are consistent through time and across contexts are coined ‘personalities’, ‘behavioural syndromes’ or ‘temperaments’. The terminology of personality is not a mere fashionable label of something usually studied by behavioural ecologists, but useful to conceptualize the common phenomenon that individuals differ markedly and consistently in their behavioural phenotypes across ecological and social contexts. The notion of personality implies that suites of behaviours are correlated within individuals and hence individuals are less flexible than would be expected under optimality models. In this course, I propose to study personality from an evolutionary point of view and also the evolution of language.

**C:** This lecture is interactive and illustrated by recent research articles.
7h will be given by A. Roulin and 7h by P. Christe

Journaux scientifiques figurant à la bibliothèque du Biophore ou sur internet (http://perunil.unil.ch/perunil/periodiques/).

**I:** Aucune
The aim of this course is to discuss some of the major transitions that occurred over the course of evolution. The general idea is that students will be able to work on a topic they selected themselves.

Students (in groups of 2 or 3) will have to identify a specific topic of interest and make a short presentation. There will then be a discussion between all participants of the course. The discussion will be lead by the students presenting and myself. Examples of topics that have previously been chosen by students include: Evolutionary explanation to the evolution of cooperation, speciation, the resolution of genomic conflict, evolution of sex chromosomes, the moulding of senescence, and the evolution of sexes.

La bibliographie sera déterminée lors du cours.

N: Master

O: The objective of this course is to learn the relevant molecular tools that are currently used in ecology, evolutionary and conservation biology research and understand why and when to apply them.

C: This course covers the reasons why molecular genetics is a necessary tool in many ecology, evolution and conservation biology projects. We study its uses and then look at a selection of techniques, particularly for looking at polymorphism, that are not traditionally taught in molecular cell biology courses. Most of the techniques can only be learnt in the classroom as there is not enough time in a week to practically learn all useful techniques. Therefore, the associated laboratory class cover some of the fast techniques that are useful for studying polymorphisms in populations.

B: The course is mostly based on publications in international journals rather than one specific book. The publications are made available in pdf format at the beginning of the course.

N: Master

P: A good grasp of the principles of population genetics and population dynamics (i.e. at least an introductory course in both)

O: Gain an understanding of how genetics and genomics interact with demographic and selective processes, with a particular emphasis on inbreeding depression and genetic rescue

website: http://www2.unil.ch/popgen/teaching/PGD21

C: In the first part of the course, selected papers from the recent literature are presented by students and discussed in a journal club format.
In the second part, in groups of 2-3 students you will use computer simulations and the quantiNemo program to investigate questions such as:
- When and how can a small population purge deleterious alleles?
- How can we quantify Inbreeding Depression?
- Is neutral diversity a good proxy for the health status of a population?

**N:** Master

**P:** Practicals performed during the bachelor (molecular biology, genetics, biochemistry, bioinformatics)

**O:** - An initiation to the work of a scientist
- Conduct experimental work in research lab (wet bench or in silico)
- Interpretation of research results
- Implement basic principles in experimental design (e.g. include the appropriate controls, statistical significance of the results etc...)
- Present your experimental work in a written report which will be organized like a typical research article (introduction, results, discussion, materials and methods)
- Present your work orally (seminar style)

**C:** Perform laboratory work for about 12 weeks during the time when the student does not follow theoretical classes. This research project will typically be performed under the guidance of a PhD student or a post-doc from the host laboratory.

Due to the sanitary evolution related to COVID-19, the study plans may be adapted during the semester as follows:

- possibility to switch from one mode of teaching to another (face-to-face <-> distance, synchronous <-> asynchronous, switch to co-modal teaching where it was not initially planned).
- adaptation of evaluation modalities, without inducing derogations from the Study Regulations (oral <-> written, exam <-> validation, individual work <-> group work, practical work <-> theoretical work, face-to-face evaluation <-> online evaluation, etc.)
- alternative or time-shifted modalities for teachings, internships, practical work, fieldworks and camps that could not take place or teachings that could no longer take place in the form initially planned.

Students are invited to consult this document regularly (Study Plan & Evaluation Procedure)

N: Master
Environmental economics is at the forefront of the response to local, national and global environmental problems and as such it has become an essential part of the thinking and actions of national and regional governments and international agencies. This course offers an introduction to the theory of the economics of the environment and natural resource management.

This course will show how economic thinking can assist real world policymaking in areas such as sustainability and resource conservation. After a brief introduction to sustainability the course will cover two different themes. First theme presents the covers the economics of non-renewable resources. The second theme will focus on renewable resources. Implications of climate change will be also discussed.

http://moodle.unil.ch/course/view.php?id=23813
What makes us such a unique species, able to cooperate in large-scale societies, organize social interactions, and dominate ecologically the Earth? The main goal of this course is to provide the foundations of social evolution, which consists of two main ingredients in humans: cooperation and cumulative cultural evolution. On one side, the course will thus focus on studying the main forces favoring and maintaining cooperation (mutually beneficial interactions, altruism) and conflict (cheating, malevolence, warfare) in group-structured populations. On the other side, we will study the forces behind cultural evolution, where behavior in interactions depends on genetic determinants, social learning, and individual learning ("gene-culture coevolution"). This will allow discussing the major steps in human social organization evolution, from primate autarky to division of labor in large-scale societies.

The course will be composed of five main parts and more focused on human behavior than the "Ecology and Evolution" class on which it builds:

1. Cooperation and conflict in well-mixed populations. Here, we will study the evolution of cooperation (and cheating) in well-mixed population (no division into groups). We will study the standard one-shot social dilemmas illustrating the tension between self-interest and group-interest, like the prisoner’s dilemma and the stag-hunt game. We will then investigate various settings of repeated interactions, where reputation dynamics between individuals are crucial to sustain long-term relationships.

2. Cooperation and conflict in group-structured population. Here, we will study the forces shaping cooperation when interactions occur in group-structured populations (the rule in humans), and where the localization of the social interactions generates in the same time novel incentives to cooperate and novel incentives for spiteful behavior. We will also consider conflicts between groups and study warfare in small-scale hunter-gather societies.

3. Social learning and gene-culture coevolutionary theory. Here, we will study the main modes of social learning ("cultural transmission"), which underlies cumulative cultural evolution that is the main determinant of the human lineage ecological success. We will also study gene-culture coevolution and how social learning impacts the dynamics of cooperation within groups.

4. Individual learning and preferences. Here, we will discuss the main modes of individual learning that allow individuals to learn information about the relevant behavior to express on their own (e.g., trial-and error learning and related decision heuristics, maximizing behavior). We will investigate the conditions under which evolution may and may not lead individuals to become equipped with goal functions ("utility maximization behavior").

5. Major transition from small to large-scale societies. Here, we will discuss the main evolutionary steps that took the human lineage in a 6 million year long co-evolutionary gene-culture ride from self reliant primate social organizations ("autarky") to large scale societies with extreme division of labor ("catallaxy"). This transition involved a zigzag path from dominance, to egalitarianism, to inequality again.

N: Master

P: BSc level in biology, including ecology

O: Applied ecology is a young crisis discipline undergoing a major effectiveness revolution. In most situations, urgent action is necessary, even in the absence of reliable information. How do we gather sound ecological information? How do we use it to plan natural communities conservation? In the process of answering these questions, wildlife ecologists often realize that research and practice are just two sides of the same coin. After this lecture, students are able to understand the underlying concept of evidence-based conservation and adaptive management. They have applied the concepts in several different conservation settings.

C: The goal of the course is to teach students some of the skills they will need as evidence-based conservationists. Practical examples will be drawn from various ecosystems, communities and species. The course will revolve around the stages of adaptive management:
- monitoring ecological resources, monitoring occupancy and abundance
- research syntheses (systematic reviews and meta-analyses)
- ecological triage (systematic conservation planning and red lists)
- natural communities conservation planning and legislative context.
Field-based case studies will provide students an opportunity to apply and discuss some of the principles illustrated in the course. Practical work will include meeting with practitioners, discussing and analyzing their approach and methods through the prism of adaptive management.

« There is no such thing as a special category of science called applied science; there is science and its applications, which are related to one another as the fruit is related to the tree that has borne it. » Louis Pasteur
BIOLOGICAL INVASIONS

N: Master

O: 1. Explain core theory and concepts underlying the spread and impacts of invasive species
2. Critically assess the current debate about invasive organisms (semantic, social, economic, biological...)
3. Understand how globalization leads to the accelerating dynamics of species ranging from viruses to mammals
4. Understand the characteristics of invasive species and vulnerable ecosystems
5. Discuss the interactions between biological invasions and other drivers of global change such as climate change

C: Biological invasions are considered one of the most important global threats to biodiversity. Understanding the processes shaping the success of species outside of their native ranges is therefore a major goal of conservation research. In this course, we elucidate the main hypotheses explaining the success and spread of invasive species, while insisting on current controversies and future research questions. Specifically, we will address:
- The different stages of the invasion process (transport, establishment, spread, impacts)
- Impacts and case studies of some of the worst invasive species
- Mechanisms of invasions
- Socio-economic aspects
- The role of rapid adaptation in the invasion process
- Species interactions, enemy release, community structure
- Large scale patterns and dynamics
- Interactions with other drivers of global change

P: Lectures, discussions, and proposal writing in English.

O: Introduction into
- some important problems of conservation biology
- funding opportunities for conservation projects
- the planning, writing, and reviewing of grant proposals in the context of the course

Own ideas shall be developed, presented and discussed in class.

C: Some current research topics within the field of conservation biology will be further introduced in lectures, potentially also guest lectures, and discussions in class. Each student then develops an own idea of a research project within these topics. After an introduction into funding agencies and the planning and writing of grant proposals, each student (or groups of two) write(s) up an own proposal and present(s) it to the class. The proposals of colleagues will then be peer-reviewed after an introduction into peer-reviewing of grant proposals.

Class size restricted to 10 students.

O: This series of lectures will show the complexity of insect societies, taking the honey bee as an example. It will give the opportunity to see how concepts learned elsewhere by the students can be placed within the context of a single species.

C: Since honeybees are economically important insects, they have been studied early in history and the knowledge we possess about them is greater than for any other social insect species. Our understanding of the honeybee reveals the complex organisation reached by insects when they form societies. This series of lectures will present some aspects of this complexity that will be replaced within its evolutionary context. Various aspects of honeybee ecology and evolution, including geophylogeny, biology, reproduction at individual and colony level, division of labour, communication, economical value, pathogens will be presented.

After a general introduction of this model species describing the diversity and biogeography of the taxon, we will dissect the communication abilities of European honeybees and compare it with related Asian species. We will see how this communication is used to organise foraging tasks sustaining colony growth. Honeybee health is a current concern and we will review the pathogens affecting them and comment the role of humans in their spread and control in an evolutionary context. Since honeybees are globally threatened, we will see what economical losses their decline could have and some conservation projects to invert the trend will be put in context.

N: Master

O: The first goal of this course is to give a general introduction into primate behaviour, with a special focus on primate cognition and culture. The topic will be developed in a comparative framework, with references to behaviours found in other animals as well as well highlighting behaviours shared between human and non-human primates and the ones unique to humans. This first part will give the general background to understand the articles that will be discussed in the seminar sessions. During the seminar, students will select articles to read and discuss together. This part aims at developing the critical thinking of students and the exchange between the students using concrete examples of research with conflicting findings. The course will train students to summarize, explain and discuss a paper during the final presentation in front of the class, as well as to develop ideas about potential future directions of the research on a specific topic.

C: This course will be composed of three main parts followed by seminar sessions.

1) Primate Behaviour. Here we will study briefly the bases of animal behaviour followed by a presentation of the diversity in the taxa Primates. Then we will study the specificities of Primate behaviour. We will investigates the topics of social structure, reproduction and life history. Later we will focus more on social relationships with lectures on competition and conflict management, communication and cooperation. All these topics will be discussed with a comparative approach to other animals and humans.

2) Primate Cognition. Here we will study the cognitive abilities of primates. We will investigate briefly the specificities of primate physical cognition and we will develop more on their social cognition. On this topic, we will study the abilities of primates to understand others’ minds (theory of mind) and to exhibit strategic social behaviours like deception.

3) Primate Culture: Here we will study social learning mechanisms and strategies. We will investigate cases of conformity, traditions and culture in primates. This subject will highlight the specificities of human cultural behaviour as well as the shared roots with primates and other animals. During the seminar, students will choose a scientific article to read (alone or in groups depending on the number of students following the course). The papers will be discuss in the class. At the end of the seminar, all the students will present the main finding of their paper and potential future directions of research on the topic.

**P:** none

**O:** Phylogenetic reconstruction methods and their application in evolutionary biology. To know and understand phylogenetic reconstruction methods in order to test the processes leading to genes and organisms evolution.

**C:** The subjects will be presented during lectures as well as practicals.

I. Reconstruction methods
- What is a phylogenetic tree and how to interpret it?
- Tree reconstruction:
  a) optimisation criteria and models of evolution
  b) search for the optimum tree
  c) Bayesian methods
- Can we trust the inferred tree?

II. Uses for phylogenetic trees
- Detecting positive selection in a coding gene
- Testing coevolution and cospeciation
- Macroevolution:
  a) dating evolutionary events
  b) tempo and mode of evolution
  c) testing for key innovations
- Phylogeny and conservation

**O:** This is a theoretical and practical course which will teach you how to write a text for an exhibition (scientific popularization). From original articles and textbooks to the exhibition content, several steps are required to make the exhibition attractive and accessible to a large audience. During this course, you will learn the basics of exhibition building, from content development to the elaboration of a mediation concept and a communication strategy.

**C:** After a 6 period’s theoretical introduction, you will develop a personal project. This year, we will propose general subjects linked to biology. We will propose individual subjects to be developed during the first lecture hours. We are also expecting from you to create a press release on your subject, as well as a mediation project.

**N:** Master  
**P:** None  
**O:** This course is intended for students who wish to acquire the principles of constraint management and decision-making from a perspective inspired by the latest discoveries in neuroscience, cognitive science and biology.

The goal is to provide practical reference points for the various actors in the economics about the functioning of the brain according to a neuroeconomic approach.

**C:** Contemporary society, as each individual, is set to change in a world with limited resources. The choices and decisions we are taking must necessarily consider the constraints imposed on producers and consumers through access to resources and their management. These same principles are found in brain function and behavior by one of its most characteristic behavior: decision-making with respect to whether investment, purchasing, risk taking, consumption are affordable. Where begins and ends the freedom of choice we make? This course analyzes the information processing by the brain and in particular the structures and brain mechanisms that are the basis of the cognitive, motor and emotional factors of behavior. A large part of the course is devoted to the illustration of concrete examples and neuroscience experiments and the description of the methodological approach, in particular neuropharmacological. Several chapters deal with the organization and characteristics of the main modulatory pathways of brain activity and their influence in neuroeconomics. A work of synthesis and bibliographical research will be assigned to the students in small groups who will have to submit a written report which will be the subject of an evaluation counting for the exam mark, as well as by an oral presentation in class of this same research which will also count for the exam score.

**IMPORTANT:** the priority is given to those students who take this course as mandatory. In order to provide an adequate support during the course, the number of students choosing this course as optional is limited. The group work is based on a maximum number of 12 groups, that is approximately 36-40 students maximum.

The reference list is indicative and goes well beyond the strict content of the course but serves to deepen the subject matter.
2. Mickaël Mangot - Psychologie de l'investisseur et des marchés financiers &ndash; Dunod, 2008

I: http://moodle.unil.ch/course/view.php?id=6808
The main objective of this course is to provide an in-depth knowledge of human behavior in organizations. Variability in behaviors—which oftentimes departs from "normative" models—emanate from many factors at various levels of analysis. For example, individual differences, groups, leadership, organizational factors and national culture will be discussed using various theoretical approaches. Students will also be exposed to articles stemming from the experimental research tradition to better grasp how behavioral scientists (industrial and social psychologists, economists, etc.), solve puzzles that concern human behavior.

Refer to the course site (Moodle) for a detailed scheme of work.

Les slides et ressources complémentaires seront mis sur Moodle.

http://moodle.unil.ch/course/view.php?id=8451
The course is open to all students of the Master in Economics, and to other interested students who have basic mathematical knowledge (e.g. doing maximization under constraint).

This course provides a graduate-level introduction to Political and Institutional Economics. The focus lies on explaining how democratic politics and electoral competition crucially matter for economic incentives, and how institutions and governance are key factors for development and for curbing the risk of conflict.

After providing a solid theoretical background to the students, we shall study cutting-edge empirical articles on these topics. Part of these recent influential articles will be discussed in student presentations.

The primary goal of the course is to familiarize the students with this increasingly important subfield of economics and to provide an overview on what cutting-edge research is currently carried out on these topics. A secondary goal of the course is also to foster the applied econometrics and oral presentation skills of the students.
This course covers the following topics:

**SECTION 1: THE BIG PICTURE: ORIGINS OF THE STATE**
- Market Failures and the efficiency arguments for the state
- Redistribution arguments for the state
- State Failure and bad politicians

**SECTION 2A: DEMOCRATIC POLITICS AND THE ECONOMY: THEORY**
- Downsian electoral competition and Median Voter Theorem
- Probabilistic voting
- Lobbying, rent-seeking and Special interest policy
- Bureaucracy
- Partisan politics: "citizen candidate" and "legislative bargaining"

**SECTION 2B: DEMOCRATIC POLITICS AND THE ECONOMY: EMPIRICS**
- Incumbency advantage
- Direct democracy
- Political dynasties
- Identity of leaders
- Information, voting and public policies

**SECTION 3A: INSTITUTIONAL ECONOMICS AND GOVERNANCE: THEORY**
- Inequality and Institution Building
- Determinants of State Capacity
- Institutions and Development

**SECTION 3B: INSTITUTIONAL ECONOMICS AND GOVERNANCE: EMPIRICS**
- Historical origin of institutions and path dependency
- Ethnic diversity and institutions
- Inequality and institutions
- Institutions and development

**SECTION 4A: ECONOMICS OF CONFLICT: THEORY**
- War inefficiency puzzle
- Contest success functions and paradox of power
- Political bias and war
- Ethnic conflict
- State capacity and conflict

**SECTION 4B: ECONOMICS OF CONFLICT: EMPIRICS**
- Ethnic diversity, discrimination and conflict
- Natural resources, climate change and conflict
- Political institutions and conflict
- Policies for Peace
- Economic and political consequences of conflict

The main handbooks that serve as references of this course are given below. The exhaustive list of references is available from the Moodle page of this course.

http://moodle.unil.ch/course/view.php?id=15085
Most of the lectures will follow papers. However, there are three textbooks in Behavioral Economics that cover several topics of the course:

</table>

**N:** Master  

**P:** Econometrics (linear regression models, panel data).

**O:** Instructors:  

**Elena Esposito - Tiziano Rotesi**

**IMPORTANT:** The first half of the class is going to be on-line.

This course intends to study economic (under)development. Students will get exposure to some of the most important debates in development economics. Moreover, they will develop familiarity with a set of econometric techniques widely used by researchers and development practitioners.

Using a mix of micro and macro approaches, the course will focus mainly on the topics of: i) food, ii) education, iii) health, iv) credit markets, risk and savings iv) gender and development, v) institutions and development.

To study these topics, we will identify a set of analytical frameworks, grounded in economic theory, and verify them with rigorous empirical evidence.

A part of the first 4 sessions will be dedicated to an introduction to the software Stata.

**B:** MAIN REFRENCE:

Reading List - assigned at the start of the course.

**OPTIONAL:**

This course introduces students to the management of different organizations (e.g.: private companies, public organizations, NGOs) and familiarizes them with different modes of management. Students shall also become aware of the broader social environment in which organizations operate. At the end of the course, students should have acquired a solid knowledge of the historical and social context in which today’s corporations are embedded, and be knowledgeable of various concepts which shall give a better understanding of management.

This year, due to the covid crisis, this course is taught 100% online. Each week you will find the videos of the different sessions on moodle. In addition, each week there will be 30 minutes live sessions for your questions. You will find the timing of those sessions for your group on moodle, as well as the link to zoom. These live sessions will start in the second week of the course.

The course is divided into several parts. First, we will define the notion of “management” and show that it is necessary to develop an adequate understanding of the environment (at various levels) in order to successfully manage an organization in a today’s globalized society. Then, we will turn our attention to the means by which a company can create value for its shareholders, clients, and employees, through some of its key functions: strategy, marketing, and human resource management.

- **Session 1, 24.09:** Introduction + The organization in its environment (PB)
- **Session 2, 01.10:** Globalization and societal transformations (PB)
- **Session 3, 08.10:** Corporate Social Responsibility (CSR) (PB)
- **Session 4, 15.10:** Governance of organizations (XC)
- **Session 5, 22.10:** Strategy (I): Business policy, game theory and strategic thinking levels (XC)
- **Session 6, 29.10:** Strategy (II): Competitive/business strategy (XC)
- **Session 7, 05.11:** Strategy (III): Vertical integration & diversification (corporate strategy) (XC)
- **Session 8, 12.11:** Deepening session
- **Session 9, 19.11:** Innovation (I) (AC)
- **Session 10, 26.11:** Innovation (II) (AC)
- **Session 11, 03.12:** Introduction to marketing (AC)
- **Session 12, 10.12:** Introduction to operational management (AC)
- **Session 13, 17.12:** Management of men and women (AC)
- **Session 14, 24.12:** Introduction to project management (PB)

http://moodle.unil.ch/course/view.php?id=22338
This course does not come with specific requirements in terms of prior knowledge and skills. As a matter of fact, the course is open to both students who are completely unfamiliar with the cognitive and decision sciences as well as to students who have had ample prior exposure to corresponding research.

How do humans and other animals make decisions? How should they best make them? Regardless of whether it comes to management, medicine, or other task domains, in the real world available information is often inherently uncertain. Moreover, decision makers typically face information-processing constraints, such as limited memory, computational power, or time. Strategies for making smart decisions under uncertainty are fast-and-frugal heuristics. Those simple rules of thumb require only limited knowledge and information-processing capacities. Counter-intuitively, relying on heuristics does not require trading off accuracy with effort or other currencies: By exploiting the statistical structure of decision making environments, heuristics can be both accurate and simple. This course offers an overview of cutting-edge, inter-disciplinary research on heuristic decision making strategies, bringing together human psychology, artificial intelligence, machine learning, business, economics, biology, and other fields.

**Target audiences:**
- **Master students** who wish to discover the world of research, be they carried out in academia itself, or in a company setting, or
- who might be interested to pursue doctoral studies and a career in academia later on, or
- who wish to prepare themselves for writing their Master thesis.

- **PhD students** who wish to take this course as part of their PhD studies.

- Finally, the course offers learning opportunities to **anyone interested** in creatively developing her or his research ideas, practicing skills such as presenting in front of group, leading a discussion, searching for academic literature, or writing clearly.
Originally developed in the cognitive and decision sciences, today fast-and-frugal heuristics have applications in many areas. This course will:

- acquaint students with theoretical and methodological foundations of research on heuristics,
- introduce different application areas, and
- allow students to freely focus on one application area that is of specific interest to them — be it in strategy consulting, management, marketing, business intelligence, data science, financial investment, human cognition (e.g., memory), social psychology (e.g., obedience to authority), biological research (e.g., Chimpanzee memory), or something else.

**Approach:**
Research on heuristics focuses on four interrelated questions. Descriptive: What heuristics do humans and other animals use? Ecological: In what environment does each heuristic yield clever decisions, and when will it fail? Applied: How can decision making be improved, for instance, by changing the heuristics people rely upon or by changing their environment? Methodological: How can the usage and performance of heuristics be studied, for example, in experiments, with computer simulations, or via mathematical analyses?

After an overview on different theories of decision making, we will start out by searching for answers to the descriptive, ecological, and methodological questions. Thereafter, we will cover different areas of applied research. Finally, students will dig deeper into a topic of their own choice. Within the chosen areas of specialization, students will develop a research project. Tangible outcome of this project development phase include formulating a research proposal or, for advanced students (e.g., PhD students), the possibility of doing actual empirical work, to be written up in a project report (e.g., a short journal article draft).

The course is divided into two parts:

1. **Academic discussion seminar:** Prior to each session, we will read selected articles and book chapters and then discuss those together in class. The idea is that participants acquire knowledge not only by thinking for themselves, but also by reflecting as a group.

2. **Developing each student’s own research project:** Students will discuss their project ideas, get feedback from the class and the instructor, and work on their project.

**Teams:**
To further facilitate learning processes, participants will be grouped into teams. The teams will prepare the assigned papers together, give joint presentations, and lead class discussions.

References to compulsory readings (scientific journal articles, book chapters) will be given in class by the instructor. Other compulsory readings will be chosen by the students themselves, namely in order to develop their research projects.

***Because of the health evolution related to COVID-19, the study plans may be adapted during the semester.***

N: Master

P: A master’s level class in ecology and evolution. Additional coursework in behavioral economics, social psychology, and/or the evolution of social behavior would certainly be relevant and helpful but are not essential.

O: Human decision making and human behavior are ultimately biological. By extension, they are evolved. Evolutionary ecology arguably represents the only possible way to integrate the study of human behavior across disciplines ranging from anthropology to economics. In spite of this tremendous potential, controversy often plagues the study of basic questions related to evolution and human behavior. In the broadest terms, this class is an extended analysis of the potential of evolutionary analyses of human behavior, the reasons for persistent controversies, and strategies for how to make significant progress.

1) The class will examine how disciplinary and methodological diversity contribute to a specific set of intractable controversies. These controversies relate to (i) the role of culture and cultural evolution, (ii) the evolution of cognition and emotion, (iii) the implications of evolution for social policy, sustainability, and human well-being, (iv) the evolution of human cooperation, and (v) the evolution of harmful and destructive behaviors.

2) The class will also analyze whether the evolutionary study of human decision making and behavior presents unique challenges not present in other fields.

3) The class will introduce the concept of evolutionary inference, which refers to how we make claims about an evolutionary process that we typically cannot actually observe.

4) The class ask students to identify key methodological problems limiting progress and propose approaches for a definitive way forward.

5) More broadly, the class will help students develop their ability to identify fundamental problems and develop strategies for solving them.

6) Students will develop skills related to giving oral presentations and proposal writing.

C: The first half of the semester will involve a series of in-depth lectures on the following topics related to evolution and human behavior.

- The evolution of psychological systems, with a special emphasis on cognition and motivation. In particular, are evolved psychological systems biased in some way? Why, for example, are we scared of snakes but not cars? Do heterosexual men tend to think women are more interested in them romantically than these women actually are? If so, how could such a bias evolve? Has our psychology evolved in a way that predisposes us to believe in supernatural agents, and if so are we scared of these supernatural agents?
- How do cultures evolve, and what does cultural evolution have to do with evolution more broadly?
- Does cultural evolution shape genetic evolutionary processes, and if so how?
- Are humans really altruistic and distinctively cooperative, and if so how could such individually costly behaviors evolve? Is cultural evolution important with respect to these questions?
- What, if anything, can a policy maker who wants a better world and a better society learn from evolution? Similarly, what can a manager do to promote the diffusion of norms and technologies within an organization that are consistent with the manager’s goal? Broader still, whether we are managers, government officials, or NGO workers, how can we recruit cultural evolutionary processes to accomplish specific social goals?
- How do we explain pervasive harmful behaviors and bad decision making from an evolutionary perspective? Why, for example, do some people harm their children? Why do entire groups of people believe things that are verifiably wrong? Why do societies persist in the use of sub-optimal technologies?

All of the above questions represent fundamental questions in the evolutionary study of human decision making and behavior. All of them receive widespread attention from large numbers of highly trained researchers. That said, all of them suffer from persistent disagreement and controversy. This controversy, and the reasons for it, will serve as a key organizing theme for the class. In particular, the second half of the semester will invite students to pick a specific problem from the list and examine the reasons for the controversy surrounding this problem. The basic task will be to isolate the methodological issues that allow controversy to persist and then propose a scientific strategy for making real progress.

Accordingly, students will present oral presentations of their work during the second half of the term. These presentations and associated feedback - feedback from both the other students and from the instructors - will allow students the opportunity to refine and improve their ideas. The final assignment for the class will be a research proposal based on the presentation and associated feedback. The ultimate task is to pick a controversy, isolate the problem, and propose an approach that will allow definitive progress.
The class will draw extensively from the primary academic literature in economics, psychology, anthropology, sociology, social policy, management, and evolutionary ecology. References will be provided with the lectures on a weekly basis during the first half of the term.

<th>English</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>3.0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

N: Master

P: None.

O: Students will learn about leadership and about developing their leadership potential. A substantial portion of the variation in organizational (and subordinate) outcomes can be attributed to leadership. As such, this course is designed to provide students with a comprehensive understanding of leadership as a phenomenon and its impact on the organizational behavior of individuals. Students will learn to think critically about leadership, the boundary conditions of leadership theories, and how to better influence others. The class will focus both on theoretical knowledge and on practice.

C: The class will discuss the following topics (theory sessions):

- Introduction to leadership
- Decision-making and its importance in leadership development
- Motivation
- Charisma
- Full-range leadership theory
- Traits and leadership
- Gender and Leadership
- Leadership development in organizations
- Personal leadership development
- Ethics and leadership
- Power and corruption

The practical sessions will be oriented towards the development and the application of concrete tools that can be used to improve one’s leadership:

- Concrete tools a practical instructions that can be followed to improve one’s leadership
- Specific tools will be presented and developed during class, based on empirical evidence
- Use of tools will be practiced during class and exercises.

Articles (available for download on the course website in Moodle).
C: Business revolves around making decisions, often risky decisions, usually with incomplete information and too often in less time than desirable. Decision-making is a business skill that managers often take for granted in themselves and others, but it is not as easy as some might think. This course will familiarize students with important approaches to decision making, thereby covering both normative and descriptive theories, as well as prescriptive tools. Moreover, various topics relevant for managers as decision makers will be discussed, for instance, intuition, group processes, the impact of time and time pressure, experience, accountability, or ethics, to mention just a few. Several examples, case-studies and exercises will illustrate how various tools can be applied to improve managerial decision making and to what extent various theoretical approaches are useful to understand what managers are actually doing.

A special focus will be on negotiations. A negotiation can be seen as the interaction of at least two parties whose interests are not aligned and who use their judgments and make decisions while trying to find an agreement. We will look at different types of negotiations, and learn about negotiation tactics/strategies. Particularly this part of the course will be quite practical, that is, include many actual negotiations and exercises, but also real cases (which have been documented for teaching purposes).

Organization of the course (and corona-adjustments):

We will start with the first session on September 21st in Anthropole 2013. The current plan is to have physical classroom sessions every week, though uncertainty about future developments may impose some constraints on us and force us to be flexible. Irrespective of this uncertainty and flexibility, a few things can already be stated now and will not change: (1) Physical presence on campus will at no point be necessary and absence will not be penalized &ndash; in fact, the grading scheme does not involve a component for contribution. (2) The sessions will be recorded and the recordings will be made available on the moodle. (3) There will be no sit-in exam at the end, but a final project, to be completed in January 2022, that will be centered around a decision-making case.

For many, if not most, decision problems it is hard or even impossible to determine what the optimal process and decision would be. As a consequence, this course involves not only lecturing and theory, but also discussion, arguments and controversies. For some weeks, a set of videos will be uploaded before class. You will have to watch these videos before the respective session, prepare the relevant assignments and upload them on the moodle platform before the deadline. Assignments have to be done either individually or in groups (the composition of some of these group will involve some random element). Most assignments will be discussed in class. We will, presumably, have (a) one community who comes to the classroom every week, (b) another one who follows remotely but in real-time, and (c) still another one who only watches the recordings of the sessions later. It is highly recommended that you come to the classroom and &ndash; finally again, after the last &ldquo;corona&rdquo; semesters &ndash; appreciate the opportunities offered by face-to-face interactions. Moreover, (b) is strongly favored over (c). We definitely cannot ensure that you get a full and good learning experience if you belong to community (c) &ndash; and even being in community (b) will come with some restrictions (e.g., you will not be able to listen to the in-class discussions and questions by your fellow students).
The course is largely (but not exclusively) based on the following literature. Some parts are required, others are recommended, more detailed information will be provided in the class.

- Inside Risk. A documentary of a kidnapping case, with a focus on the negotiation with the kidnappers, (not publicly available).

I: http://moodle2.unil.ch/course/view.php?id=5140
A large part of economic activity takes place within firms. In modern economies the total value of within-firm transactions is approximately equal to that of market transactions and the worldwide value of mergers and acquisitions is in the trillions. Understanding why firms exist, why they grow or shrink over time, and how they operate is essential. The course builds on prominent approaches in organizational economics and combines theoretical concepts with empirical data (experiments, field data) and managerial decision-making (case studies). The central topics are governance choices (vertical integration and outsourcing) and the internal organization of firms (incentives, hierarchies, and leadership).

The course has two parts. In the first half of the course, we focus on governance choices. In this part we are interested in understanding why firms sometimes decide to vertically integrate (e.g. Netflix's decision to produce their own original content) and sometimes decide to outsource parts of their business (e.g. Acer's decision not to manufacture many of their products inhouse anymore). This discussion will lead us to some of the leading theories of the firm such as transaction cost economics and the property rights approach. Using a series of real-life case studies, we will examine how these theories can inform practical management decisions in the context of mergers and acquisitions and outsourcing. We will discuss some of these case studies together and you will work on other case studies in groups. You will put yourself in the shoes of a consulting team that prepares a presentation for the top management of a company.

The second half of the course concentrates on the internal organization of firms. A central problem in firms is that the natural incentives existing in pure market transactions are no longer present. We therefore discuss how managers can motivate their employees to operate in the interest of their firm. The principal-agent model delivers important insights on this issue. It illustrates how managers should structure compensation plans, which information they should use and how closely they should monitor their employees depending on the firm's technology, the characteristics of the work environment and the employee's preferences. Building on these basic principles for the provision of explicit incentives, we will extend the agency model and apply it to more complex and realistic environments where multi-tasking, teamwork and intertemporal spillovers make the motivation of workers difficult. We will see that in those contexts extrinsic motivation through rewards and sanctions alone will often not suffice to achieve the desired results. This leads us to a discussion of the role of social motives, norms and leadership. The case studies for the second part will be related to employee motivation problems in various industries and contexts.

I:  http://moodle.unil.ch/course/view.php?id=22208
